

## Abstract

5 Described is a composition which is suitable for removing adhering substances, such as (synthetic) resins, paint lacquers, polymer foams and mastics by means of forming a dispersion. The composition comprises at least one amphoteric compound and optionally a surfactant substance.

10 There are also provided for the first time polymers or mixtures of polymers which are at least practically free of organic solvents and a method for producing these, i.e. by separation from the above stated dispersion.
